WHAT IS CLAIMED IS:

1. A method of jointing a cutting edge of at least one cutting blade of a rotating tool, wherein between the tool and at least one straight jointing stone a radial advancing movement is carried out and wherein the jointing stone has an active jointing area that is longer than a length of the cutting edge, the method comprising the step of:

performing during jointing at least one relative stroke between the jointing stone and the cutting edge in a longitudinal direction of the cutting edge, wherein the at least one relative stroke has a stroke length that is shorter than the length of the cutting edge.

- 2. The method according to claim 1, wherein the jointing stone is longer than the cutting edge by the length of the relative stroke.
- 3. The method according to claim 1, wherein during jointing at least two relative strokes are performed in opposite directions.
- 4. The method according to claim 1, wherein the at least one relative stroke has a stroke speed that is multiple times smaller than a rotational speed of the rotating tool.
- 5. The method according to claim 1, wherein the stroke length is such that a rearward end of the jointing stone, when viewed in the stroke direction, projects past the cutting edge at the end of the relative stroke.
 - 6. The method according to claim 1, wherein the jointing stone is

comprised of at least two jointing stone members arranged in the stroke direction at a relative spacing to one another, respectively, and wherein the stroke length is greater than the relative spacing.

- 7. The method according to claim 6, wherein the jointing stone members each have a length shorter than the length of the cutting edge.
- 8. The method according to claim 1, wherein the stroke length is multiple times shorter than the length of the cutting edge.
